

# Utilising Data as a Catalyst for Improvement

Tuesday, Oct 31, 2023 3:00-4:00pm

Room 213

Lloyd Provost, Institute for Healthcare Improvement and Associates in Process Improvement  
Kate Bones, Institute for Healthcare Improvement

# Objectives

---

- Appreciate the difference in data for Improvement and data for accountability.
- Describe the ways that data informs an improvement project.
- Experience an example of an improvement project that effectively uses data to learn and communicate results.
- List the common visual methods to learn from data for improvement.

PERFORMANCE MEASURES AND MEASUREMENT

# The Three Faces of Performance Measurement:

## Improvement, Accountability, and Research

"We are increasingly realizing not only how critical measurement is to the quality improvement we seek but also how counterproductive it can be to mix measurement for accountability or research with measurement for improvement."

# Data for Improvement, Accountability and Research

Aspect	Improvement	Accountability	Research
Aim	Improvement of care	Comparison, choice, reassurance, spur for change	New knowledge
Test Observability	Test observable	No test, evaluate current performance	Test blinded or controlled
Bias	Accept consistent bias	Measure and adjust to reduce bias	Design to eliminate bias
Sample Size	“Just enough” data, small sequential samples	Obtain 100% of available, relevant data	Sample to use inference methods, “Just in case” data (oversampling?)
Hypothesis	Hypothesis flexible, changes as learning takes place	No hypothesis	Fixed hypothesis
Variation	Adjust measures to reduce variation	Design to eliminate unwanted variation	Accept consistent variation
Testing Strategy	Sequential tests	No tests	One large test
Determining if change results in improvement	Run charts or Shewhart control charts	No change focus	Hypothesis, statistical tests (t-test, F-test, chi square), p-values
Data confidentiality	Data used only by those involved with improvement work	Data available for public review	Research subjects’ identities protected

# Measurement for Judgment and Accountability

These data may not be very helpful to an improvement team testing changes to reduce waiting time.

# Measurement for Learning and Improvement

Tracking actual waiting time will be more useful than solely tracking the % that meet a waiting time standard.

## Measurement for Judgment and Accountability

## Measurement for Learning and Improvement

Measurement for judgment often results in data recorded as 100% or 0%, limiting opportunities for learning from the measure.

Tracking the % of patients who have not smoked provides the team with a strong degree of belief that their changes yielded improvement.

# Measurement for Judgment and Accountability

# Measurement for Learning and Improvement

Percentile rankings can create confusing situations. Did improvement occur because of the changes tested? Or because of others' poor performance in the comparison pool?

Improvement teams will find it more helpful to track the actual average satisfaction scores in their organization.

# Family of Measures (FOM)

- Health care systems are complex.
- Any single measure used as the sole means of determining improvement to a particular system is inadequate.
- When working to improve a system, multiple measures are usually necessary to better evaluate the impact of our changes on the many facets of the system.
- Improvement projects typically require a family of 2-8 measures

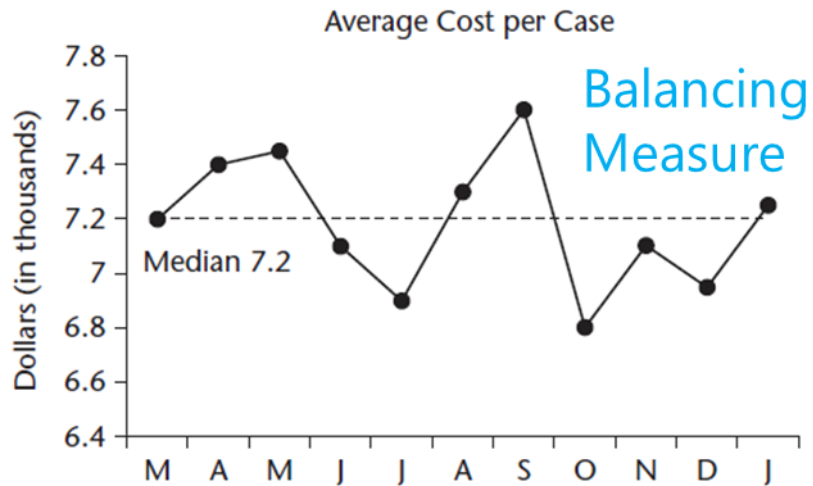

FIGURE 2.9 Multiple Measures on a Single Graph

Improved LOS but readmissions are creeping up

# Surgical Safety Family of Measures

# Guidelines for Collecting Data for Improvement

- A few key measures that clarify the aim of the improvement effort and make it tangible should be regularly reported throughout the life of the project
- Be careful about over-doing process measures. A balance of outcome, process and balancing measures is important
- Plot data visually on the key measures over time
- Make use of existing databases and data already collected for developing measures.
- Whenever feasible, integrate data collection for measurement into the daily work routine.
- The second question of the MFI, “How will we know that a change is an improvement?” usually requires more than one measure. A balanced set of three to eight measures will ensure that the system is improved.

# Why do we need to learn from graphs of the data?

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov
Measure (%)	83	80	81	84	83	85	68	87	89	92	91

**"Plotting measurements over time turns out, in my view, to be one of the most powerful devices we have for systemic learning...** Several important things happen when you plot data over time. First, you have to ask what data to plot.

In the exploration of the answer, you begin to clarify aims, and also to see the system from a wider viewpoint. *Where are the data? What do they mean? To whom? Who should see them? Why?* These are questions that help you to clarify aims and systems all at once...

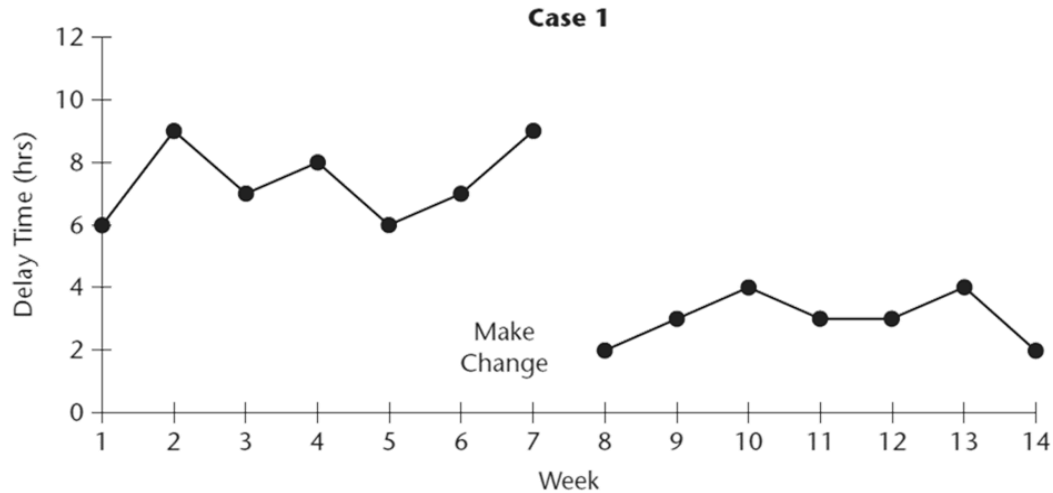

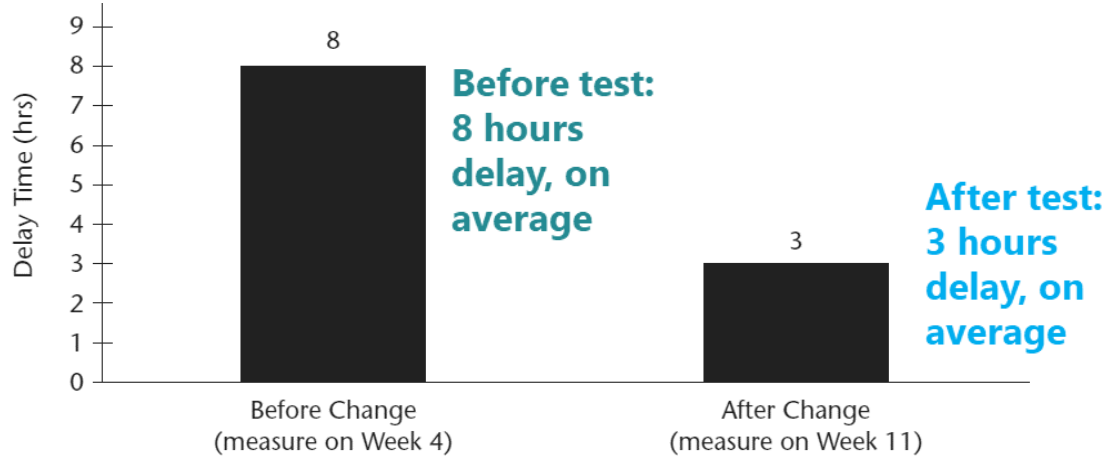

**If you follow only one piece of advice from this lecture when you get home, pick a measurement you care about and begin to plot it regularly over time. You won't be sorry."**

*– Donald M. Berwick MD, 1995,  
National Forum for Quality Improvement in Health Care*

# Science of Improvement Understanding Variation

# The Pioneers of Understanding Variation and the foundation for the Science of Improvement

W. Edwards Deming  
(1900 - 1993)

Walter Shewhart  
(1891 - 1967)

# Shewhart's Theory of Variation

A fundamental concept of the science of improvement is that variation in a measure has two potential origins: common causes and special causes.

Walter A. Shewhart, Ph.D.  
1891–1967

*Another half-century may pass  
before the full spectrum of Dr. Shewhart's contributions  
has been revealed in liberal education, science, and industry.*

W. Edwards Deming

**Common Causes** are inherent in the system over time, affecting everyone working in the system and all system outcomes.

**Special Causes** are not part of the regular system but arise because of particular circumstances or some “special” source of variation that can be assigned to some identifiable cause

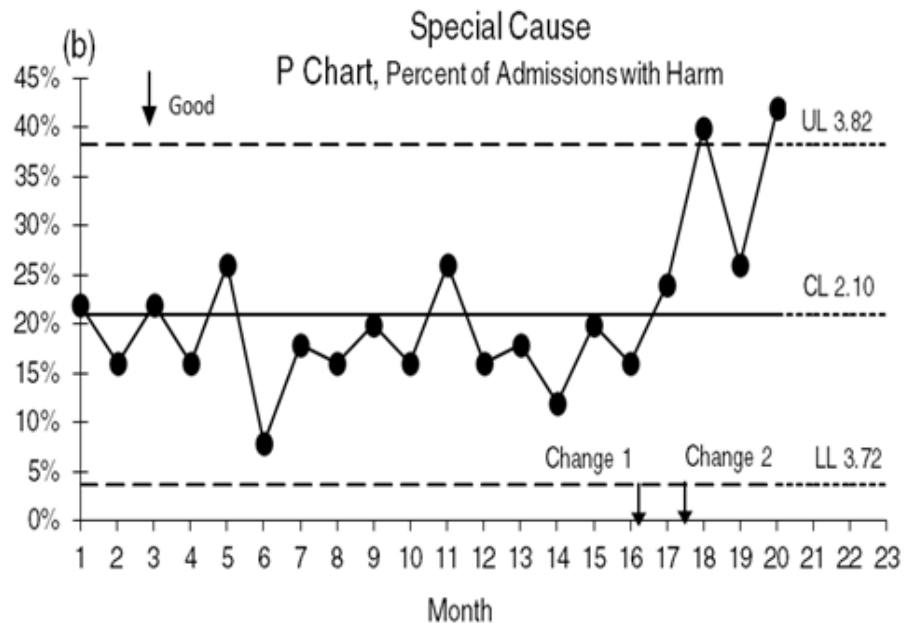

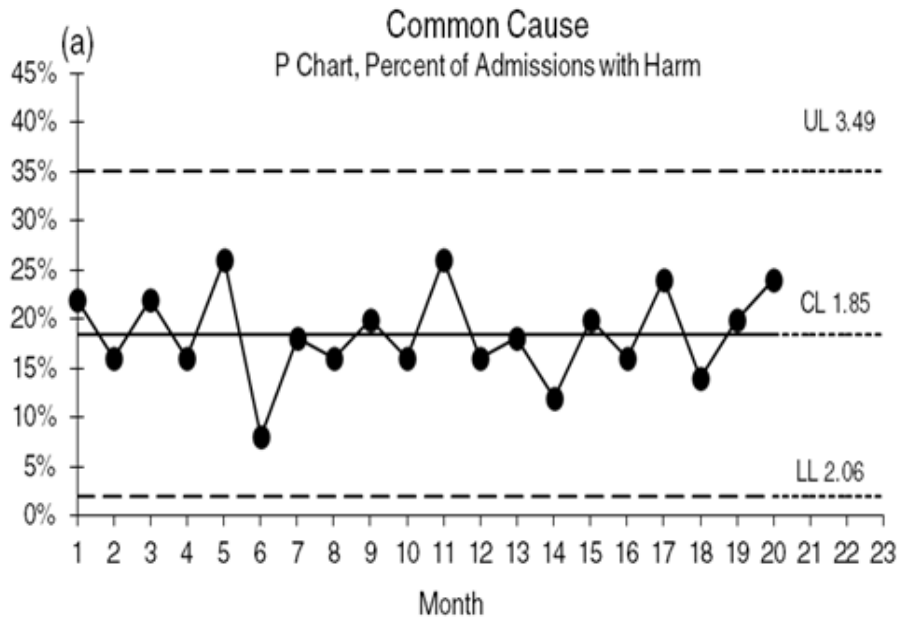

# Using the Tool.....

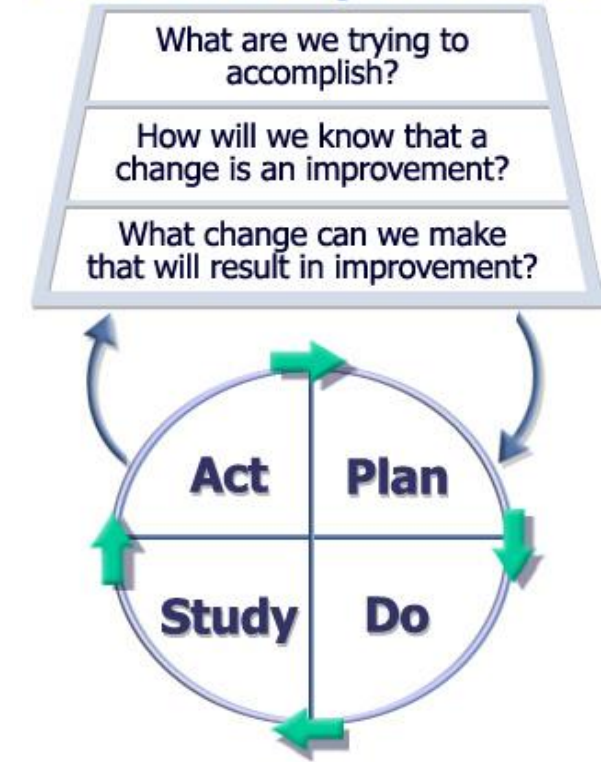

# Shewhart Charts Useful in All Parts of Model for Improvement

## What are we trying to accomplish?

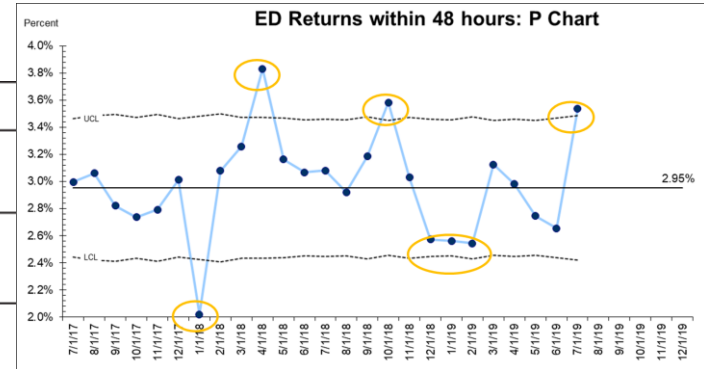

Shewhart charts for baseline project measures can be used to decide whether an improvement effort should be focused on fundamental changes or to fixing the current system or process

## Model for Improvement

# Use of Shewhart's Theory to Guide Improvement

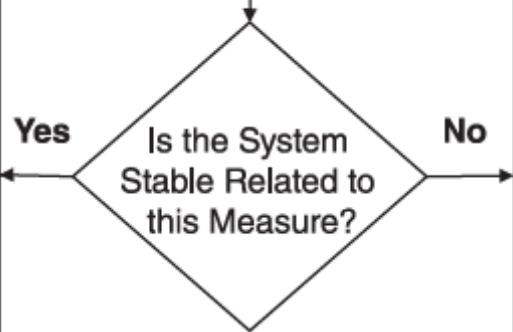

Select a Key Measure Related to the Aim of the Improvement Effort

Develop an Appropriate Shewhart Chart for the Measure

**Identify Common Cause(s)**  
**Tools/Methods:**  
 -PDSA Tests of Change  
 -Cause and Effect Diagram  
 -Rational Subgrouping  
 -Planned Experimentation  
**Responsibility:\***  
 1. Subject or technical experts  
 2. People working inside the healthcare process(es)  
 3. Patients and family

**Change the System to Remove or Reduce Common Cause(s) of Variation**  
**Responsibility:\***  
 1. Healthcare management at the appropriate level

**Identify Special Cause(s)**  
**Tools/Methods:**  
 -Shewhart Charts  
 -Cause and Effect Diagram  
 -Rational Subgrouping  
 -PDSA Tests  
**Responsibility:\***  
 1. People working inside the healthcare process(es)  
 2. Local healthcare management  
 3. Subject or technical experts

**Learn from and Act on Special Cause(s)**  
**Responsibility:\***  
 1. Local process supervisors (e.g charge nurse)  
 2. Subject or technical experts (e.g. infection control)  
 3. Healthcare management at the appropriate level

\*Lists are ordered by importance

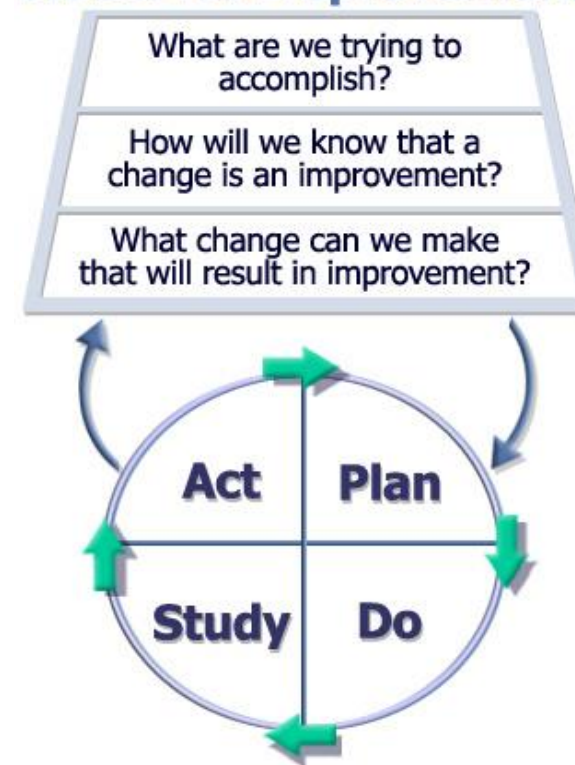

# Shewhart Charts Useful in All Parts of Model for Improvement

## How will we know that a change is an improvement?

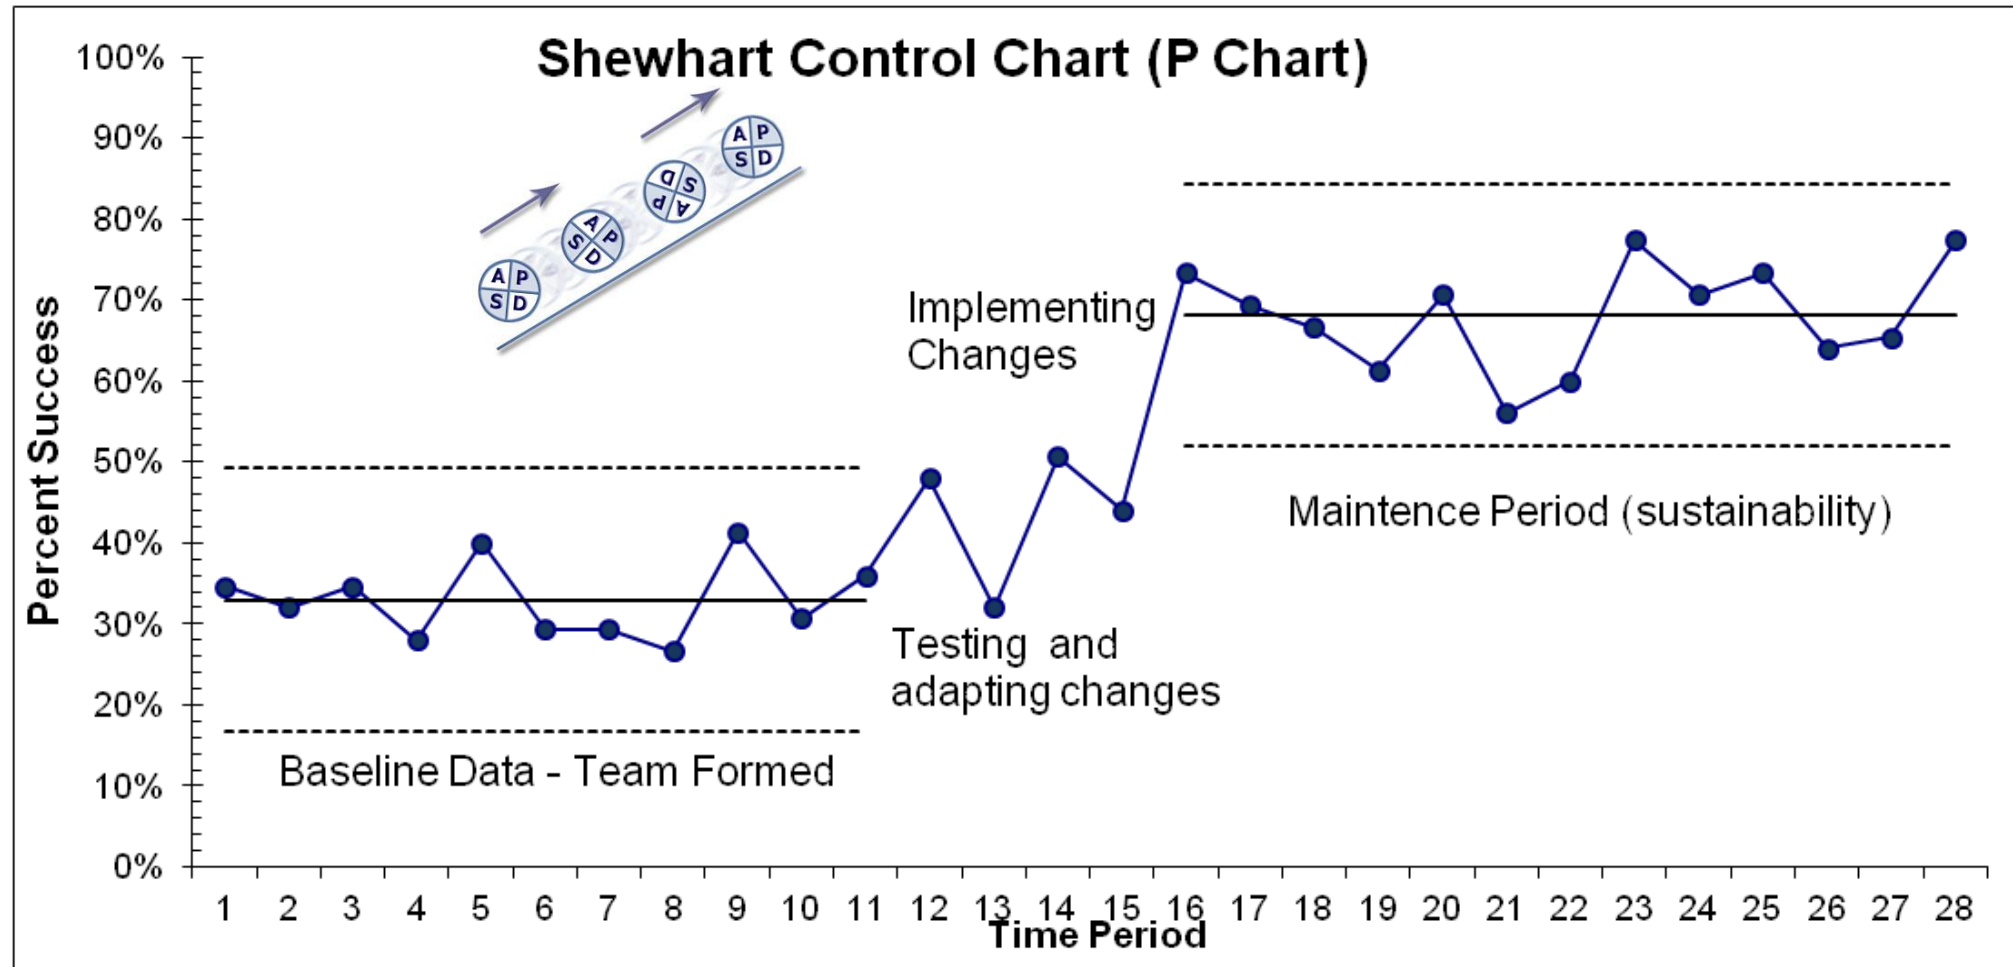

The Shewhart chart method provides a formal way to decide whether observed variation in a measure of quality should be attributed to changes made or to other causes of variation in the system (Figure 4.8).

## Model for Improvement

# Updating a Shewhart Chart after Signals of Improvement

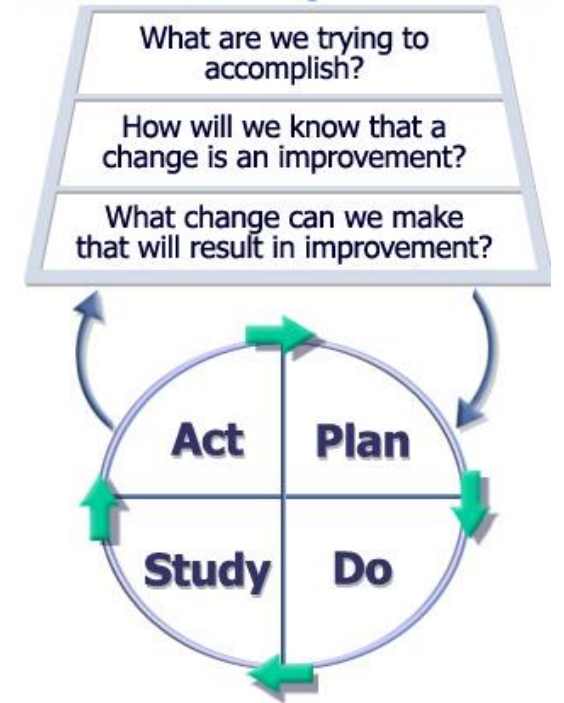

# Shewhart Charts Useful in All Parts of Model for Improvement

## What changes can we make that will result in improvement?

- Can help determine focus for the next PDSA cycle
  - identification, understanding, or removal of common causes (fundamental redesign of the system)
  - or focus on understanding and taking action on special causes of variation (fixing the current system).
- Used to detect causes of variation which can lead to ideas for change.
- Stratification, which includes disaggregation and rational subgrouping, is used with Shewhart charts to aid in developing ideas for change.

## Model for Improvement

# Detecting Variation Which Could Lead to Ideas for Change

FIGURE 4.9 Shewhart Chart Using Rational Subgrouping

FIGURE 4.10 Shewhart Chart Using Stratification

Depicting and Interpreting

**FIGURE 4.5** Detecting “Losing the Gains” for an Improved Process

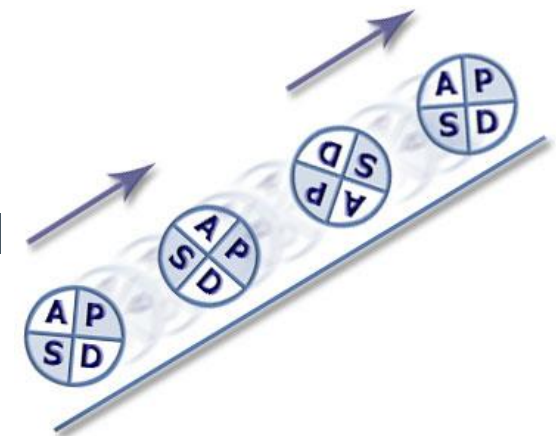

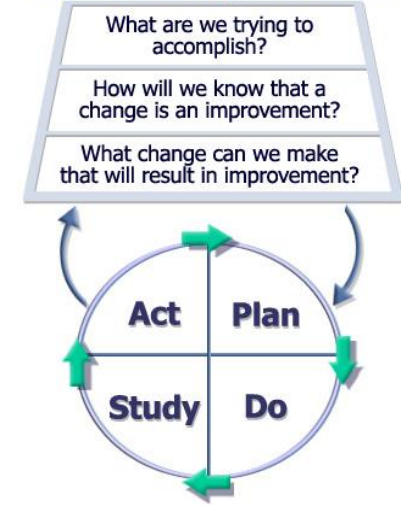

# Shewhart Charts Useful in All Parts of Model for Improvement

## What are we learning while testing using PDSA Cycles?

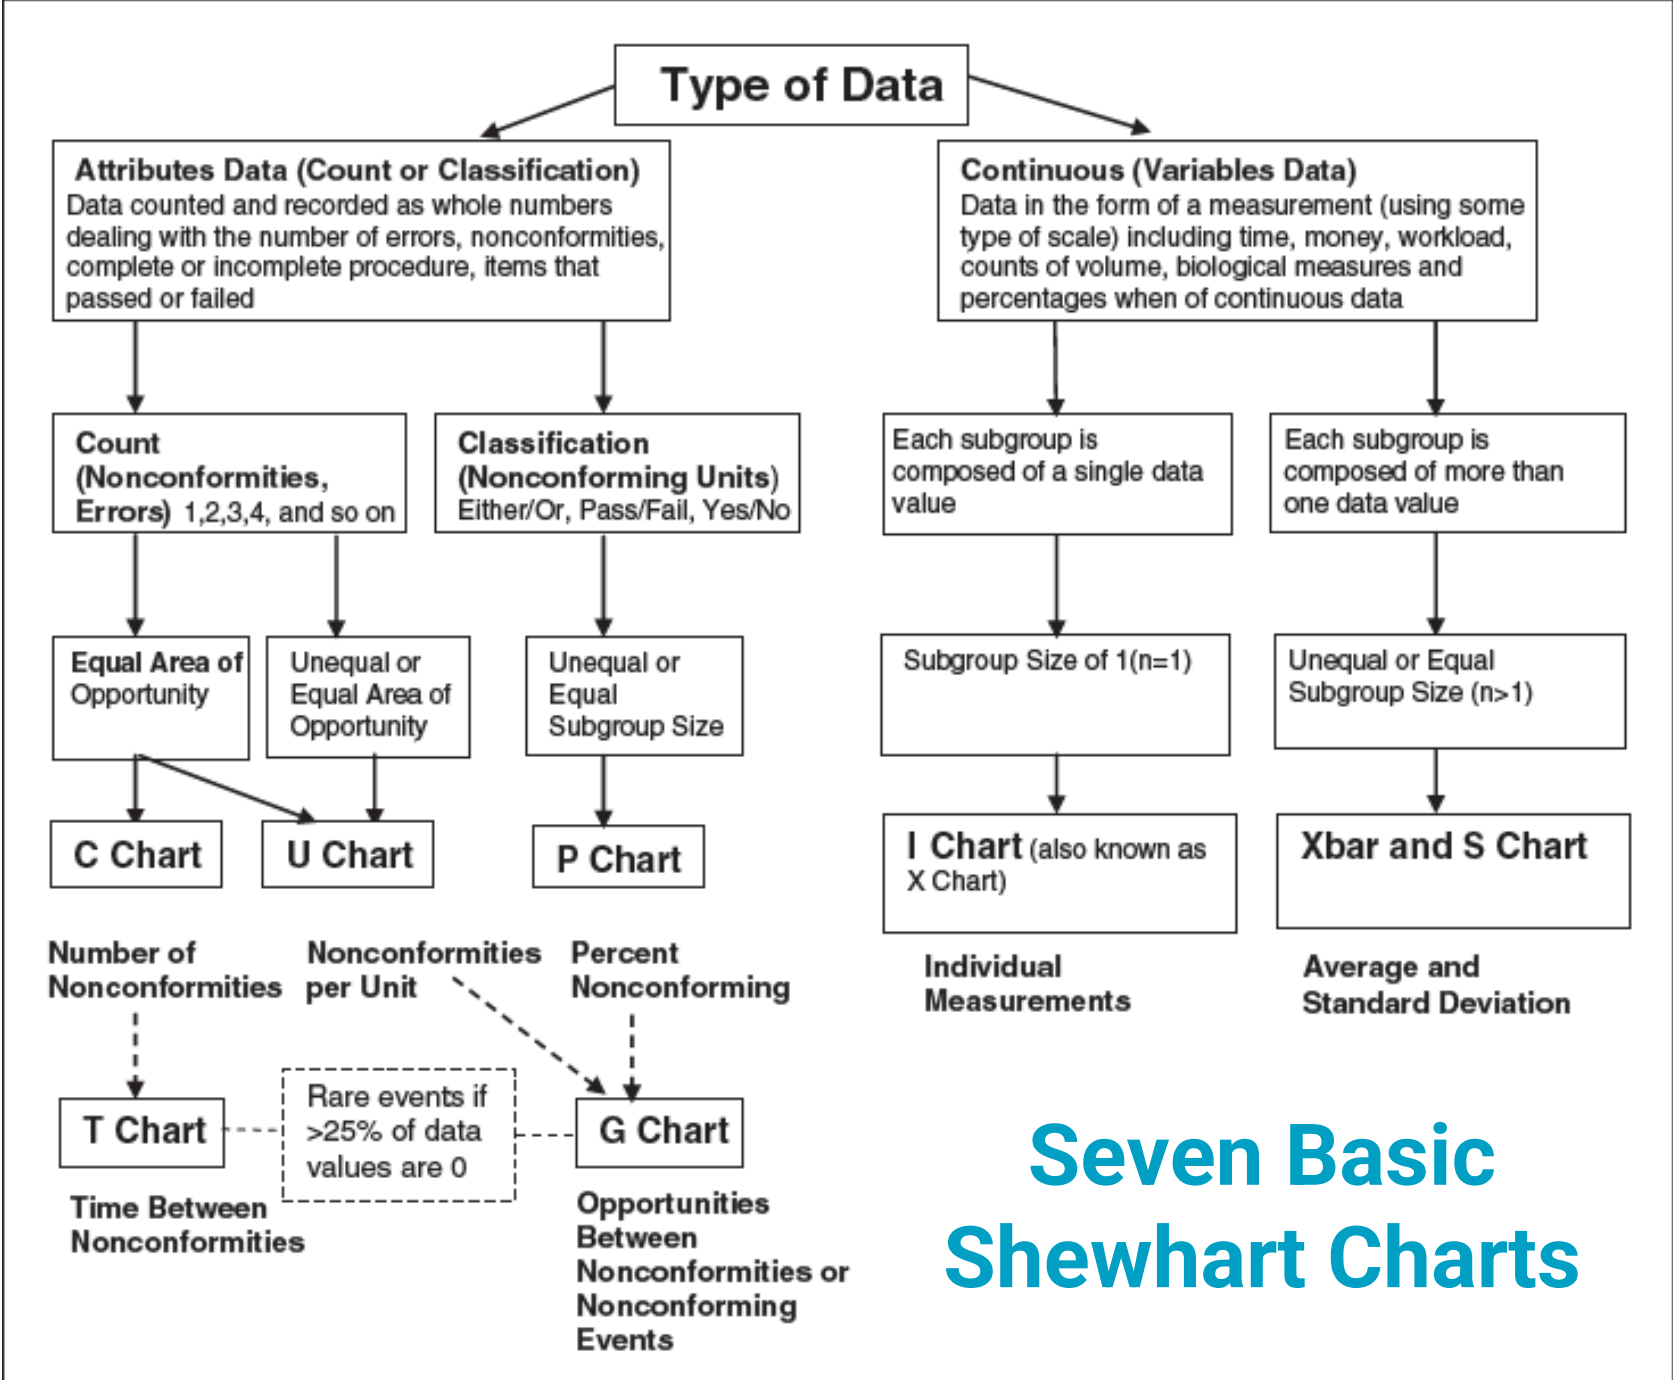

- Shewhart chart can be a key aid in learning during PDSA cycles.
- Making predictions prior to testing changes is key to good science and good learning.
- Reduces hindsight bias and focuses the study during the cycle.
- Teams should always make **predictions** about a change(s) before testing.
- Evidence always compared to prediction
- Improvement is determined using the Shewhart chart.
  - If the changes resulted in improvement the Shewhart chart would reveal evidence of favorable special cause after testing the change(s).
  - If the change tested didn't yield improvement the Shewhart chart would show no evidence of favorable special cause.

### Model for Improvement

# Different Shewhart Charts depending on type of data and how it is organized.

7 Basic charts and many advanced options

# Seven Basic Shewhart Charts

# Annotation – the key to learning with Shewhart charts

# The key strategies to prevent preterm birth

## More than 26,000 Australian babies are born too soon each year.

New research discoveries have led to the development of key strategies to safely lower the rate of preterm birth and are continuing to make pregnancies safer for women and their babies.

1

No pregnancy to be ended until at least 39 weeks unless there is obstetric or medical justification.

2

Measurement of the length of the cervix at all mid-pregnancy scans.

3

Use of natural vaginal progesterone (200mg each evening) if the length of cervix is less than 25mm.

4

If the length of the cervix continues to shorten despite progesterone treatment, consider surgical cerclage.

5

Use of vaginal progesterone if you have a prior history of spontaneous preterm birth.

6

Women who smoke should be identified and offered Quitline support.

7

To access continuity of care from a known midwife during pregnancy where possible.

AUSTRALIAN  
Preterm Birth  
Prevention  
ALLIANCE

These strategies have been approved and endorsed by the Australian Preterm Birth Prevention Alliance.

# Driver Diagram

## AIM

To safely reduce the rate of preterm and early term birth by 20% across participating maternity services by March 2024

## PRIMARY DRIVERS

**Leadership and Culture** supportive of preterm and early term birth prevention

**Empowered Women** able to make informed decisions

**Safe and Effective PTB Prevention**

**Optimal Timing of Birth**

## SECONDARY DRIVERS

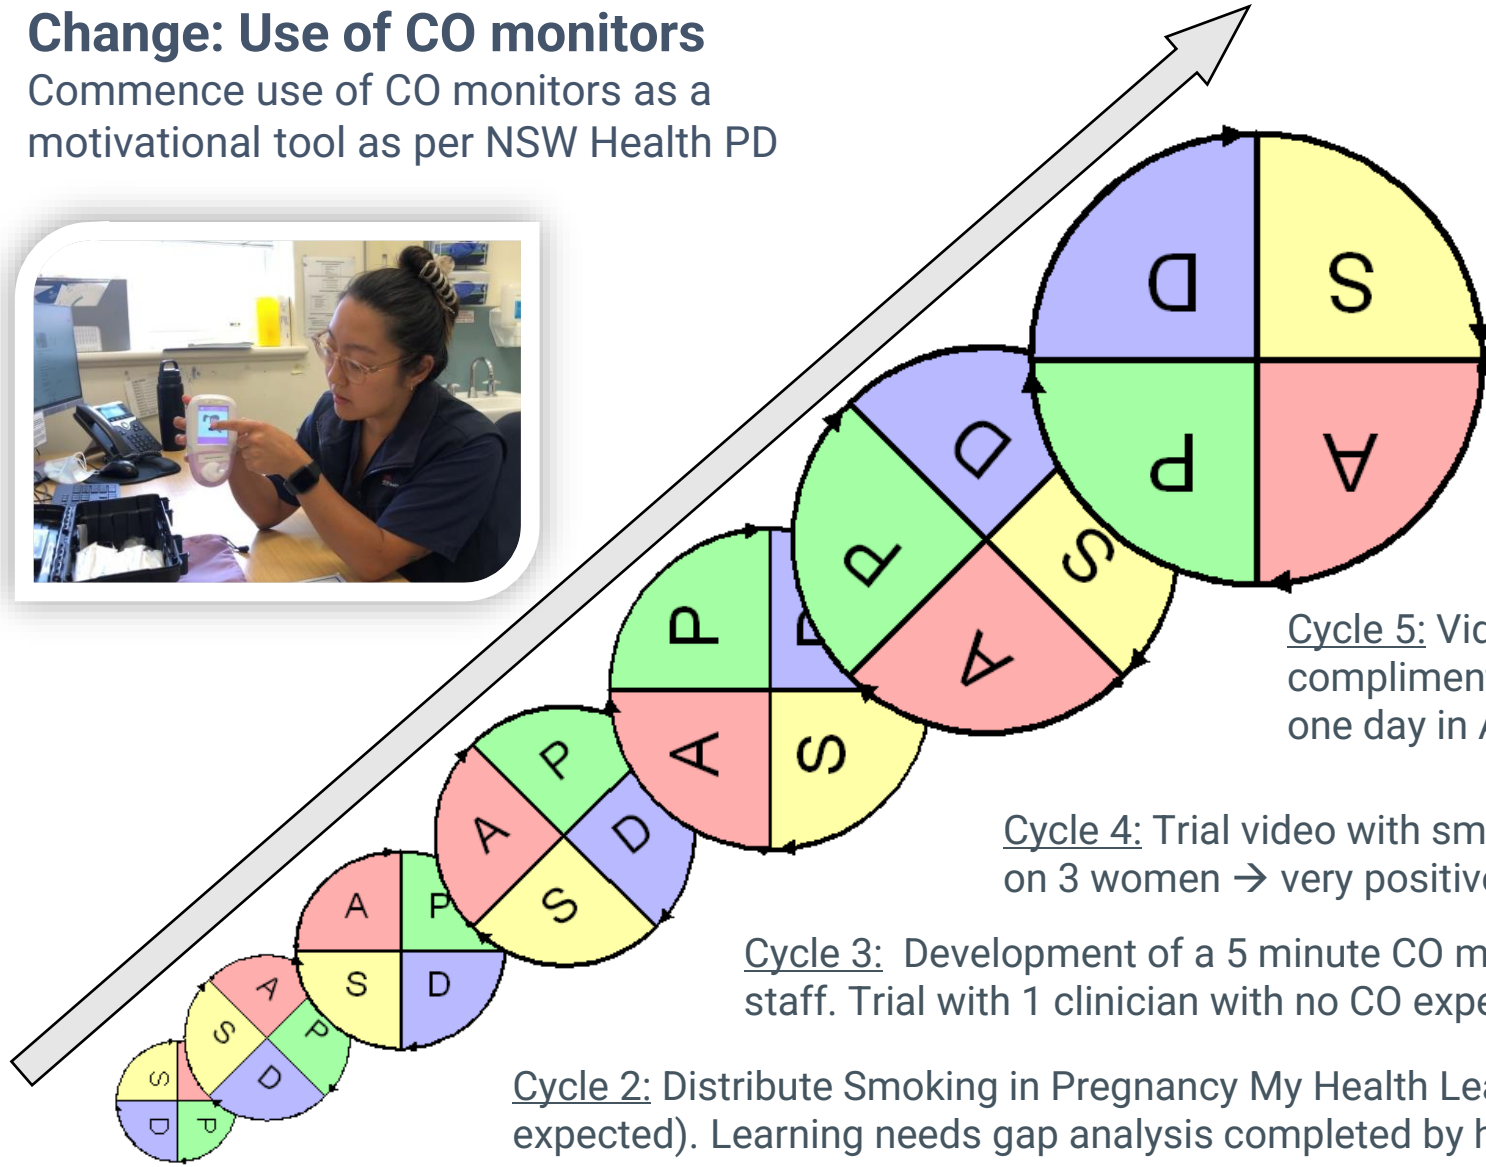

- Build collective understanding of proven strategies and benefits of safely reducing preterm and early term birth
  - Identify and equip clinical champions to inspire colleagues to participate in PTB and early term birth prevention
  - Utilise data to support learning and clinical practice
- Build understanding of PTB risk factors and the need for early engagement with health care services
  - Educate women during pregnancy on benefits of safe prolongation of pregnancy
  - Conduct shared decision making with women to support decisions about PTB prev and timing of birth
  - Codesign PTB prevention pathways with populations experiencing inequities in outcomes
- Offer continuity of carer for all women at risk of preterm or early term birth throughout pregnancy
  - Identify and support women who smoke during pregnancy to quit
  - Measure cervix length at all mid -pregnancy scans (19-20 wk anatomy scan) and refer at risk women
  - Prescribe natural progesterone 200mg to be used each night from 16 -36 weeks gestation when cervix is <25mm and consider use where woman has history of spontaneous PTB
  - Offer cerclage to women where medically indicated
  - Promote strategies to safety extend pregnancy in the presence of medical/pregnancy complications
- Confirm reliable pregnancy dating processes are operational and effective where appropriate
  - Embed opportunities within the antenatal journey to support timing of birth discussions
  - Develop clinical decision support processes and clinical review to support optimal timing of birth where there is no obstetric or medical indication

## Change: Use of CO monitors

Commence use of CO monitors as a motivational tool as per NSW Health PD

St George Hospital & Community Health Services

Cycle 1: When completing PTB education with staff, inform about pending implementation of CO monitors → staff requested more information.

Cycle 2: Distribute Smoking in Pregnancy My Health Learning modules to staff → poor completion (as expected). Learning needs gap analysis completed by health district in collaboration with all staff.

Cycle 3: Development of a 5 minute CO monitor video in collaboration with experienced staff. Trial with 1 clinician with no CO experience → minor amendments.

Cycle 4: Trial video with small group of midwives and completed CO monitor on 3 women → very positive feedback and staff engagement.

Cycle 5: Video sent to wider group of midwives and doctors complimented with staff self-testing using the CO monitor. Tested for one day in ANC and with 1 medical officer → ongoing + feedback.

Cycle 6: Started using CO monitors for all women seen by midwives → further support required for medical staff.

Cycle 7: Tested during busier doctors' clinic with F2F training → plan for ongoing education and compliance checks.

Process 5:  
Planned birth  
(37.0 – 38.6  
weeks') with  
appropriate  
indication

**3% Improvement**

Baseline Mean = 91.61%  
Current Mean = 94.47%

**27% Improvement**

Baseline Mean = 59.36%  
Current Mean = 75.41%

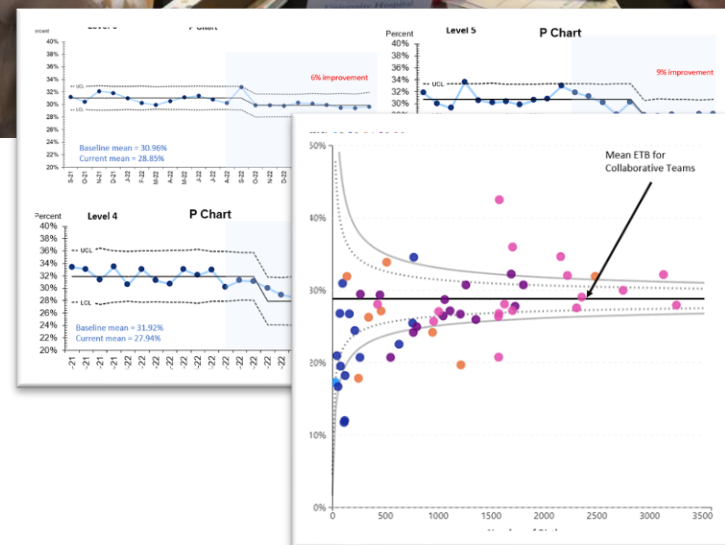

DIFFICULT  
ROADS  
LEAD TO  
BEAUTIFUL  
DESTINATIONS

- Our process measures are important! They are providing us insight into the causal pathway to results
- We are 10 months into the Collaborative and we are "watching this space" for impact on Preterm Birth
- Impacts to-date on Early Term Birth are positive and we need to keep going and focus on sustaining the progress

# Data to support on-going learning

- Aggregate outcomes using P' chart
- Small multiples by team to understand experience with process measures
- Small multiples by hospital service level and jurisdiction
- Funnel plots to identify and learn from outliers
- Scatterplots to understand relationship between process and outcome

# Using Data in the Collaborative

## Enablers

- Strong clinical leadership
- Hands-on sessions
- Jurisdiction level coaching
- Access to patient-level outcome data

## Challenges

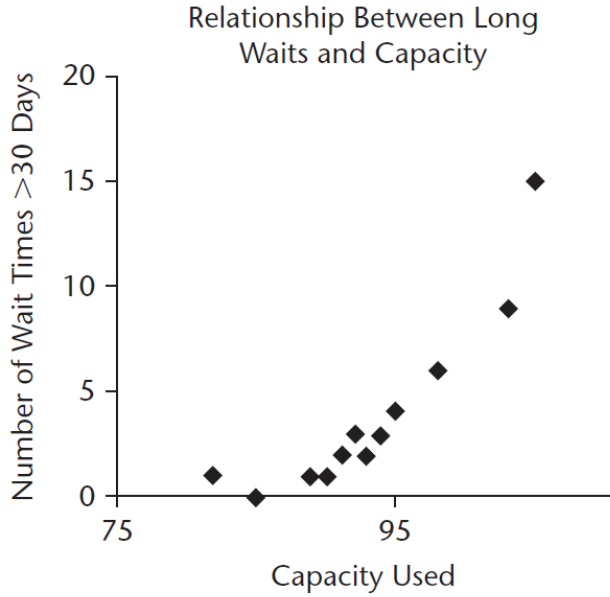

- Using data for improvement in a data for research world
- Piloting process measures real-time...and not always getting it right

# National Preterm Birth Prevention COLLABORATIVE

**Learning Session 3, Brisbane  
14-15 August 2023**

# Tools to Learn from Variation in Data

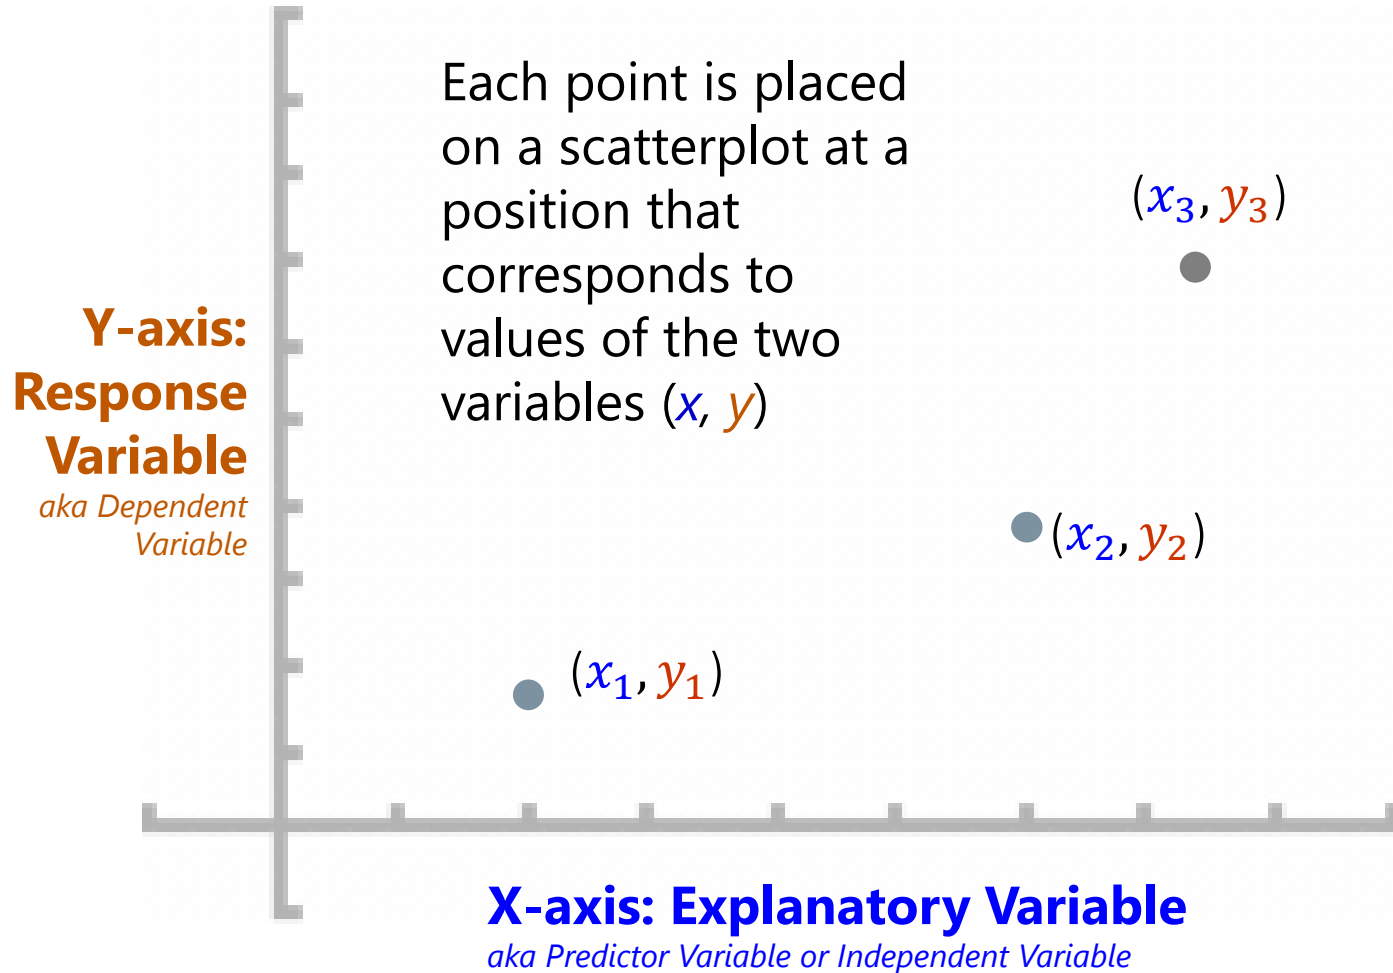

HC Data Guide, p. 65, P. 136-146

# Scatter Plots

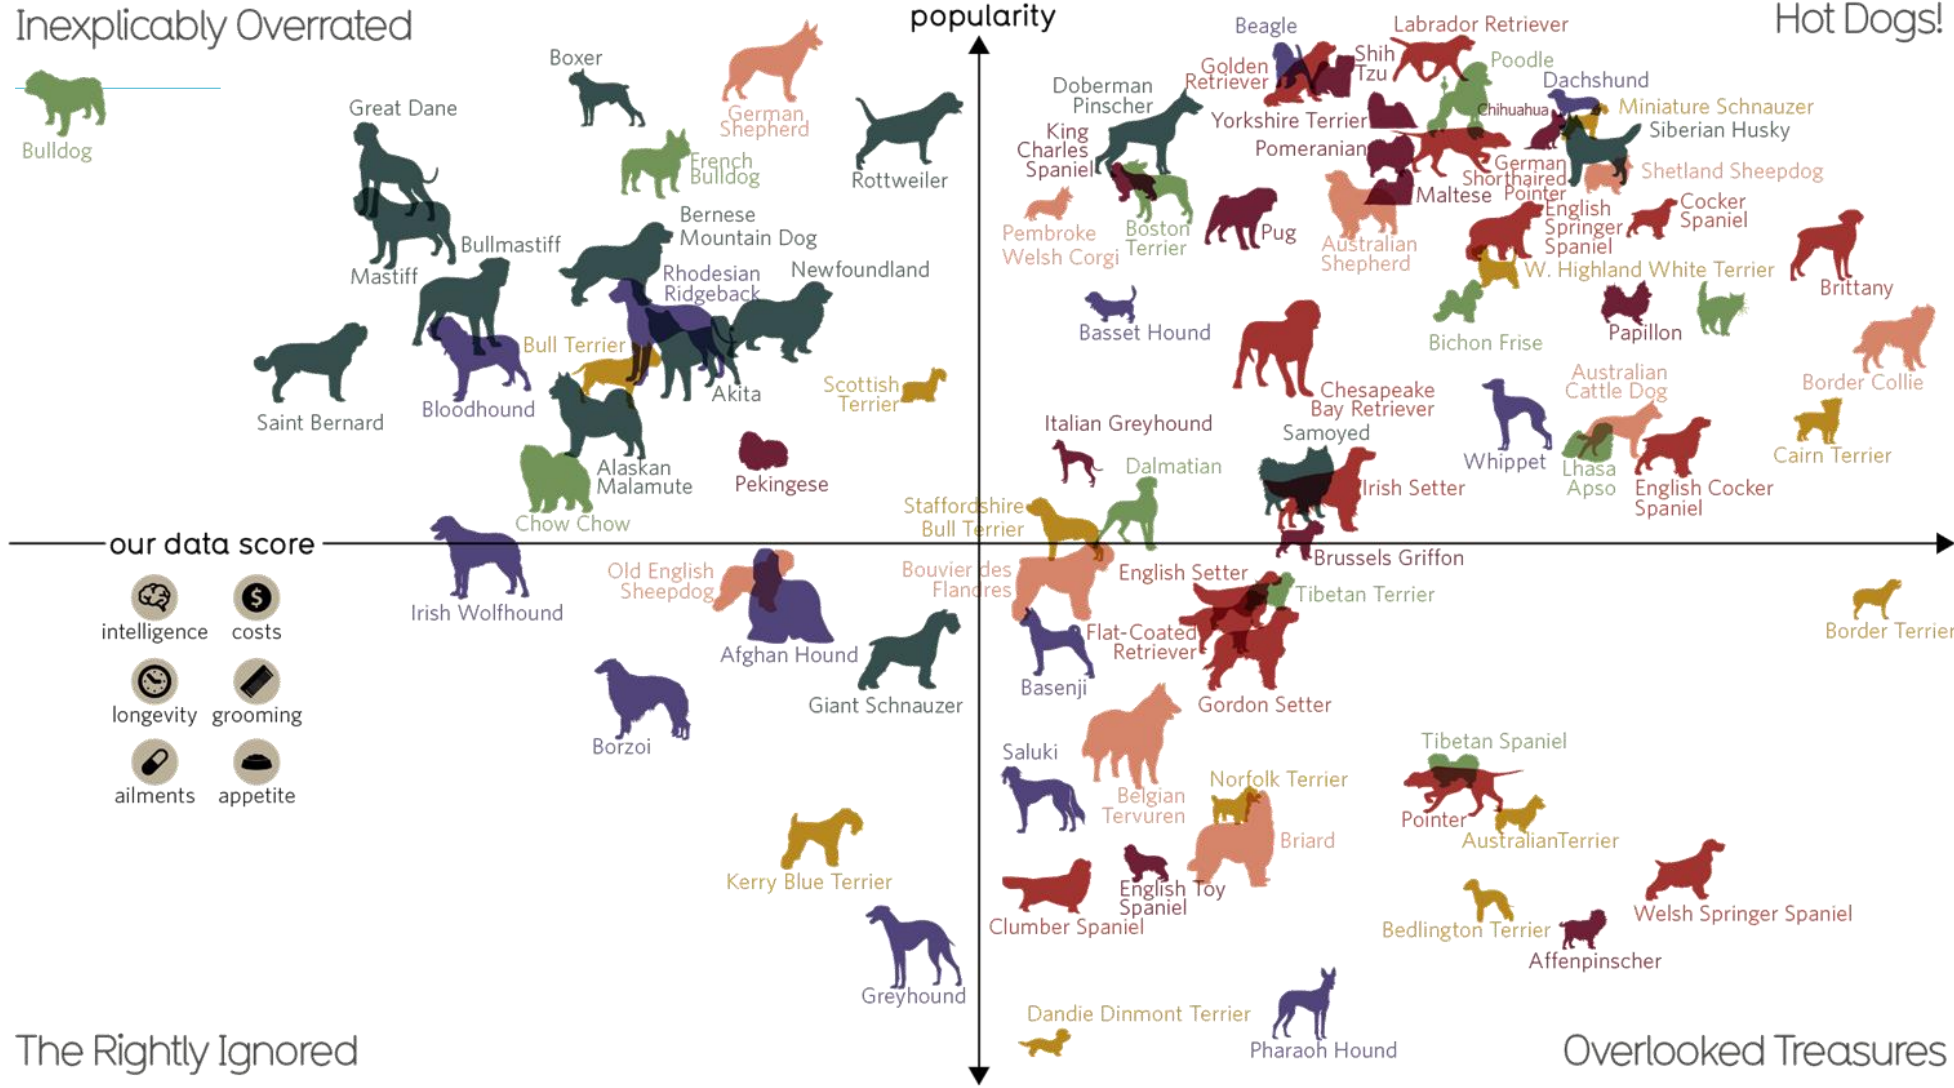

- Effective display for trends, patterns, and relationship for two variables
- Useful to look at relationships between outcome and process measures
- Understand special cause signals on Shewhart Charts
